may be possible that Malay influence brought the final elaboration which formed the gabled superstructure. The pile house is never used in the water and is found only on raised ground. The native explanation of why the more eastern parts of the Murngin country do not possess the mosquito house is that there are not so many mosquitoes here and the ordinary hut with the fire in front works better than the mosquito house. It is probably true, since the morasses of the Goyder and Glyde Rivers breed more mosquitoes than any other part of the country.

Another type of shelter found in the north is the stone cave dwelling. Dwellings of this type are used during the wet season in the lonely hill country in the interior, on Wessel Island, and sporadically around Buckingham Bay.

2. Articles That Are Worn

Although the nights of the dry season are at times quite cold, no clothing has been invented or borrowed by these people, as were kangaroo skin cloaks farther south.

It has been said that need does not produce invention, and the Australian black has been pictured as an example of this theory. Such criticism is colored by the prejudices of our own social standards. The days in Arnhem Land are always warm. No clothes are needed for comfort. The occasional cold nights are made comfortable by windbreaks and small fires built to produce ample warmth. In other words, instead of using one of our methods, the Australian has utilized a different invention to combat the cold. During the rainy season clothes are a hindrance rather than a help.

It has been asserted further that the black lacked the intelligence to invent clothes, since as soon as he came in contact with white civilization he donned the habiliments of Caucasian culture. He has, around white settlements where native civilization has disappeared, adopted the clothing of western civilization, but this is not so much an adoption by his own culture of an element of white civilization to meet his needs, as a more or less complete abandonment of his own material culture and his adoption of the white men as his master and the white men's culture as his own. The wearing of clothing has done more harm, destroyed more natives, made the aborigine far less adapted to his natural surroundings in the north, than has almost any other element of white culture. His naked condition before the coming of the white man was far more appropriate to the country he lived in.

String.—String is basic to most of the articles worn by the Murngin. All string, composed of only two strands, is made of vegetable or animal fiber: the inner bark of certain trees (the hibiscus, in particular), the inner bark of their roots, and opossum fur or human hair. The string of vegetable matter is usually fine and carefully twisted, while the other is loosely woven
